

SUPERPROMPT “ Vault Router UI Redesign > Paste everything below this line into the agent. --- You are a senior DeFi frontend engineer and brand designer. Your job is to **redesign the visual layer** of an existing, working Next.js app so it looks like a serious, institutional-grade DeFi product “ with the punchy brand identity of **CoW Swap** and the cinematic scroll animation of **TradingView's Space Mission page**. You are restyling, not rebuilding: all wallet, contract, and data logic already works and must not change. ## 0. Read this first “ what the previous build got wrong The current UI was produced by an agent that misunderstood the brief in specific, identifiable ways. Every one of these is a hallucination or a default it fell back on. Do not repeat them. Each item is: **what it believed** “ **what is actually true** (the "actually true" side is verified against the live reference sites and the CoW Swap open-source repo, not guessed). 1. **It hallucinated that "institutional finance" = light glassmorphism.** It shipped a pale-blue canvas, translucent frosted panels with `backdrop-blur`, and four animated "aurora" gradient blobs. “ Real institutional DeFi surfaces (CoW Swap, trading terminals) are **dark, opaque, high-contrast, and typography-led**. Frosted glass + pastel glow is the universal signature of a vibe-coded template, the exact opposite of legitimacy. Verified: CoW Swap's surfaces are solid `#18193B` navy on darker canvas “ zero translucency, zero blur. 2. **It mistook ambient decoration for "animation-heavy."** It added infinite loops that mean nothing: drifting blobs (20“26s), panning gradient text, shimmer sweeps on buttons, floating elements. “ TradingView's Space Mission is animation-heavy in a completely different sense: **choreographed, scroll-driven scenes** “ pinned sections, full-bleed pre-rendered video, reveals and counters that fire exactly once at the right scroll moment. Motion there always narrates content; nothing loops in the background for vibes. Delete every ambient loop; replace with choreography (Â§3, Â§4). 3. **It defaulted to Inter for everything.** Inter headings + Inter body is the most recognizable tell of a generated UI. “ CoW Swap's "punch" is mostly typography: a distinctive display grotesk (**Studio Feixen Sans** “ confirmed in their shipped woff2 files) for headings/buttons/tabs, a mono (**Studio Feixen Mono / JetBrains Mono**) for every number. Use **Space Grotesk** as the free stand-in for display; Inter is demoted to long body text only. 4. **It used stock Tailwind palette colors** (`blue-600` accent, emerald/rose semantics on a near-white canvas) “ i.e., it had no brand opinion at all. “ Adopt CoW Swap's actual verified palette from their `libs/ui/src/colors.ts`: navy `#18193B` paper, `#052B65` / `#012F7A` depth blues, electric `#00A1FF` primary, **yellow** `#F2CD16` as a scarce punch accent, success `#00D897`. A brand is a small number of opinionated colors used consistently “ not a default scale. 5. **It gave every panel equal weight.** The dashboard is a flat grid of same-sized cards, so nothing is the product. “ CoW Swap centers **one oversized focal widget** (the swap card) and arranges everything else around it. Here, `DepositCard` is that widget on `/app`. Hierarchy is the layout decision, not card styling. 6. **It rendered financial data as marketing cards instead of tables.** Activity, queues, and strategies live in rounded stat-cards. “ Finance legitimacy comes from **dense data tables** (see CoW Swap's advanced orders table): mono tabular numerals, right-aligned numbers, row hover, status chips, visible column structure. Cards are for marketing; tables are for money. 7. **It applied one motion language everywhere.** The same

reveals/float/shimmer run on marketing and inside the app. â†’ These are two different products: **marketing** = cinematic (pinned GSAP scenes, scrubbed timelines, Lenis smooth scroll), **app** = instant (150â€”250ms micro-interactions only, no smooth-scroll hijack, a trader never waits for an animation). 8. **Do not hallucinate the references' tech stack either** â€” two facts agents reliably get wrong, both verified here so you don't have to guess: - TradingView's Space Mission uses **no animation framework at all**. Its page source and JS bundles contain no GSAP, no Lottie, no Rive, no three.js â€” it is pre-rendered `.webm`/.mp4`` video scenes in sticky sections, choreographed with plain `IntersectionObserver``. You will **recreate the effect** with the toolkit in Â§4; you are not copying their stack. - **GSAP and ALL its plugins** (ScrollTrigger, SplitText, MorphSVG, â€¦) are 100% free, including commercial use, since Webflow acquired GreenSock (April 2025). Do not avoid SplitText/ScrollTrigger on the outdated belief that they're paid "Club" plugins. Everything below is the full spec. Where the old build conflicts with it, the old build loses. ## 1. The project - **Path:** `/mnt/adiii_dev/Ethereum-dev/vault-router-ui`` - **Stack:** Next.js 14 (App Router) + TypeScript, Tailwind CSS 3.4, framer-motion 11, wagmi 2 + viem 2 + RainbowKit 2, TanStack React Query 5. - **What it is:** An institutional ERC-4626 USDC yield vault (EIP-2535 Diamond) on Arbitrum that routes deposits across Aave, Morpho, and Pendle. - **Three surfaces:** 1. **Marketing** â€” ``src/app/(marketing)/`` â†’ ``/,`` ``/docs`,`` ``/security`` (Hero, Pillars, StrategyShowcase, HowItWorks, Architecture, Integrations, SecurityTeaser) 2. **User app** â€” ``src/app/app/`` â†’ ``/app`,`` ``/app/strategies`,`` ``/app/transparency`` (VaultStats, DepositCard, PositionPanel, WithdrawQueuePanel, ActivityPanel, StrategyList, TransparencyView) 3. **Role-gated consoles** â€” ``/app/curator`` (CuratorConsole) and ``/app/admin`` (AdminConsole), gated by ``src/components/shell/RoleGate.tsx`` ### Files you WILL touch (visual layer only) - ``src/app/globals.css`,`` ``tailwind.config.ts`,`` ``src/app/layout.tsx`` (fonts) - Everything in ``src/components/marketing`,`` ``src/components/app`,`` ``src/components/shell`,`` ``src/components/ui/`` - JSX structure and classNames inside components are fair game. ### Files you will NOT touch - Any hook, wagmi config, contract ABI/address, viem call, React Query logic, or the role-gating logic itself. If a component mixes logic and markup, change only the markup/classes and keep every hook call and handler identical. ### What to kill (the current theme â€” delete it entirely) The app currently has a light "liquid glass" theme: pale blue canvas, frosted translucent panels with ``backdrop-blur`,`` animated "aurora" gradient blobs (``AuroraBackground.tsx``), panning gradient text, shimmer buttons. **All of it goes.** It reads as vibe-coded, not institutional. Replace wholesale with the system below. No glassmorphism, no aurora blobs, no gradient-pan text, no shimmer, no emoji anywhere. ## 2. Reference A â€” CoW Swap (clone this for the APP surfaces) Reference: <https://swap.cow.fi/#/1/advanced/WETH/0xA0b86991c6218b36c1d19D4a2e9Eb0cE3606eB48?tab=open&page=1> Clone CoW Swap's look as closely as possible, re-skinned for Vault Router. Its verified design DNA (taken from their live site and open-source repo ``github.com/cowprotocol/cowswap``): ### Typography (the single biggest "punch" factor) - CoW Swap uses **Studio Feixen Sans** (Regular/Medium/Semibold/Bold) + **Studio Feixen Mono**, with Inter as secondary. Studio Feixen is a paid commercial font â€” do not pirate it. - **Use instead:** ``Space Grotesk`` (Google Fonts, via ``next/font``) for all display/headings/

buttons “ it has the same quirky geometric-grotesk personality “ and keep `JetBrains Mono` for every number, address, and table cell. Inter stays for long body text only. - Headings are big, tight (`tracking-tight`), and Semibold/Bold. Buttons and tabs use the display font, never the body font.

Color (CoW Swap's verified palette from `libs/ui/src/colors.ts` “ adopt dark-first) - Canvas / page background: very dark navy `#0B0C24` “ `#18193B` (their `paperDark` is `#18193B`) - Card/panel surfaces: `#18193B` on darker canvas, deep blue depth layers `#012F7A`, `#021E34` - Primary brand blue: `#00A1FF` (electric, used for primary actions and highlights) - Supporting blues: `#005EB7`, `#004293`, dark anchor `#052B65` - Punch accent: yellow `#F2CD16` “ use sparingly: key CTA, active tab underline, the one number that matters - Semantic: success `#00D897`, alert/warning `#FFCA4A`, danger keep a rose/red - Keep existing venue colors (Aave `#2dd4bf`, Morpho `#6366f1`, Pendle `#d946ef`, Idle `#94a3b8`) “ they work on dark. - Text: near-white `#F1F3FA` primary, desaturated blue-grey muted text.

Layout & "cuts" - ****Chunky, confident cards:**** solid (opaque) surfaces, 16“24px radius, visible 1px borders in a lighter navy “ no blur, no translucency. - ****One focal widget:**** CoW Swap centers an oversized swap card; mirror that “ `DepositCard` becomes the centered, oversized focal widget on `/app`, with stats arranged around it. - ****Pill tabs**** exactly like their `Open / Filled / Cancelled` order tabs: use for Deposit/Withdraw/Request-Exit and for activity filters. Active tab gets the yellow underline or filled pill. - ****Dense data tables**** like their advanced orders table: mono tabular numerals, row hover states, right-aligned numbers, status chips. Use for ActivityPanel, WithdrawQueuePanel, StrategyList, TransparencyView, and both consoles. - High-contrast section breaks: alternate `#0B0C24` and `#18193B` bands instead of floating cards on a glow. - Their stack for feel reference: styled-components + framer-motion + react-spring + lottie-react. We keep Tailwind, but the rendered result should be indistinguishable in spirit.

3. Reference B “ TradingView Space Mission (clone this for the MARKETING surface) Reference: <https://www.tradingview.com/space-mission/> Verified from the page source “ its "heavy animation" is ****not**** a JS animation framework. It is: - ****Pre-rendered video scenes****: `` served in `.webm` + h. 264 + h.265 variants, full-bleed - ****Sticky/pinned scroll sections**** (`scrollWrapper`) where scenes swap and progress as you scroll - ****IntersectionObserver-driven choreography**** (confirmed in their `space\_mission\_landing` bundle) “ elements reveal, counters fire, videos play exactly when their section enters the viewport - Huge cinematic typography over the scenes, with stat callouts Recreate that **experience** for the marketing pages using the toolkit in Â§4: - ****Hero:**** full-viewport pinned dark scene. Headline animates in word-by-word (GSAP SplitText). Background = an abstract animated "liquidity routing" visual (Rive/Lottie vector animation, or a looping rendered `.webm` if available) “ dark navy space with `#00A1FF` light streams routing into vault blocks. - ****Pillars / HowItWorks / Architecture:**** each becomes a full-bleed pinned scene “ ScrollTrigger pins the section while scroll progress scrubs a timeline (diagram draws itself, allocation flows animate, numbers count up). - ****Stats:**** big counters (TVL, strategies, audits) that count up on first viewport entry. - ****StrategyShowcase:**** horizontal scroll-scrub gallery of the three venue cards.

4. Mandated animation toolkit “ install and use these explicitly 1. ****`gsap` + `ScrollTrigger` + `SplitText`**** “ THE

industry standard for this genre of scroll-cinematic page. Pinning, scrubbing, timelines, text reveals. GSAP and all its formerly-paid plugins are 100% free including commercial use since Webflow acquired it (April 2025) â€” use them freely. Use `useGSAP()` from `@gsap/react`. 2. **`lenis`** â€” smooth/inertial scrolling; pair it with ScrollTrigger (`lenis.on('scroll', ScrollTrigger.update)`). Marketing surface only. 3. **`framer-motion`** (already installed, v11) â€” keep for component-level micro-interactions in the app surfaces: `AnimatePresence` page transitions, layout animations on tab switches, button taps, panel mounts. Don't use it for scroll-scrubbed scenes â€” that's GSAP's job. 4. **`@rive-app/react-canvas`** (preferred) or **`lottie-react`** â€” for the hero vector animation and any animated brand mark/loader. (CoW Swap itself ships `lottie-react`.) 5. **`@number-flow/react`** (or GSAP-tweened counters) â€” for animated stat numbers and live-updating vault figures. 6. **Scroll-scrubbed video technique** (the actual TradingView trick): if/when video assets exist, a `` whose `currentTime` is driven by ScrollTrigger progress, sources in `.webm` + `.mp4`. Build the component; ship with the Rive/Lottie fallback until real footage exists. **Motion rules (non-negotiable):** - Respect `prefers-reduced-motion`: every scene must degrade to static layout with simple fades. - Animate `transform` and `opacity` only; 60fps; no layout thrash. - Lazy-load below-fold scenes and Rive/Lottie payloads (`next/dynamic`). - App surfaces (anything under `/app`) get fast, subtle motion only (150â€”250ms) â€” the cinematic stuff lives on marketing pages. A trader checking a position should never wait for an animation. **## 5. Page-by-page spec** | Surface | Direction | |---|---| | `/` marketing | Full TradingView-style cinematic: pinned hero, SplitText headline, scroll-scrubbed scenes per section, count-up stats, dark navy throughout | | `/docs`, `/security` | Same brand, calmer: typographic, generous spacing, simple reveals | | `/app` dashboard | CoW Swap clone: centered oversized DepositCard widget, pill tabs, VaultStats as a top strip of mono-numeral stat blocks, ActivityPanel as dense table | | `/app/strategies` | Orders-table aesthetic: venue rows with color chips, allocation bars, expandable detail | | `/app/transparency` | Data-room feel: dense tables, on-chain proof links, mono everywhere | | `/app/curator`, `/app/admin` | Same system, denser â€” "operator terminal": tighter spacing, more table, confirmation states with the yellow accent reserved for destructive/critical actions | **## 6. Hard rules** 1. Dark-first. The light liquid-glass theme is deleted, not kept as an option. 2. No emoji, no decorative gradients, no blur/glassmorphism, no stock-photo feel. 3. Every numeral in the app is tabular mono (`font-variant-numeric: tabular-nums`). USDC amounts formatted `1,234,567.89 USDC`. 4. Contrast â‰¥ 4.5:1 for text; keyboard navigable; `prefers-reduced-motion` honored everywhere. 5. Zero changes to hooks, contract calls, wagmi/RainbowKit config, React Query keys, or RoleGate logic. 6. `npm run build` must pass clean at the end. Restyle RainbowKit via its theme API to match the navy/electric-blue system. **## 7. Acceptance checklist (verify before you finish)** - [] Space Grotesk renders on all headings/buttons; JetBrains Mono on all numbers/tables - [] Palette is the CoW-derived navy/electric-blue/yellow system; no trace of the old pale-blue glass theme or AuroraBackground - [] Marketing hero is a pinned GSAP scene with SplitText reveal and a Rive/Lottie (or video) background - [] At least three marketing sections are scroll-scrubbed pinned scenes; stats count up on entry - [] Lenis smooth scroll active on marketing, absent on `/app` - [] `/app` is centered-widget + pill-tabs +

dense tables, visually parallel to swap.cow.fi - [] Reduced-motion mode
verified (everything readable with animations off) - [] All wallet flows
(connect, deposit approve+deposit, withdraw, role-gated consoles) still work
untouched - [] `npm run build` passes
